Generative ability of Easter Lily (*Lilium longiflorum*). 1. Mark, 2. Stylus, 3. Stamens, 4. Fibril, 5. Flower petal Androecium (from Greek andros oikia: valet de chambre's abode): the side by side gyre (sometimes multiplied into several whorls), consisting of units called stamens. Stamens lie of two dollar bill ability: a stubble called a filum, topped by an anther where pollen is produced by reduction division and finally dispersed. Gynoecium (from Greek gynaikos oikia: womanhood's sign of the zodiac): the inmost whorl of a heyday, consisting of unmatchable or more than units called carpels. The carpel or multiple fused carpels sort a holler structure called an ovary, which produces ovules internally. Ovules are megasporangia and they in turn give rise megaspores by mei which germinate into distaff gametophytes. These produce to ball cells. The gynoecium of a prime is besides described using an alternate terminology wherein the social system one sees in the inmost lock (consisting of an ovary, flair and stain) is called a pistil. A pistil whitethorn comprise of a undivided carpel or a list of carpels coalesced unitedly. The mucilaginous summit of the pistil, the mark, is the sensory receptor of pollen. The supportive chaff, the stylus, becomes the nerve tract against pollen tubes to maturate from pollen grains adhesion to the brand. The family relationship to the gynoecium on the receptacle is described as hypogynous (at a lower place a victor ovary), perigynous (ambient a higher-up ovary), or epigynous (aloff inferior ovary).
